Cloud Strategy

Selecting the right set of cloud services can be both confusing and costly if not done properly. Additionally, the traditional, vertically oriented, organizational structures that manage legacy IT services tend to struggle managing cloud services and must transform accordingly.

The strategy you employ to develop, deploy, and manage cloud services is critical to successful execution in the cloud space.

Operational Efficiency

Service Pliability

CLOUD SECURITY CONSULTING PROVIDES A SECURE END TO END SOLUTION.

Strategy

Selecting the right set of cloud services can be both confusing and costly if not done properly. Additionally, the traditional, vertically oriented, organizational structures that manage legacy IT services tend to struggle managing cloud services and must transform accordingly.

The strategy you employ to develop, deploy, and manage cloud services is critical to successful execution in the cloud space.

Let Skyrym help you define your cloud strategy to be an enabler of your business.

Workload Analysis

Once a cloud strategy is determined, your workloads need to be analyzed in order to determine their compatibility with cloud services, and as a precursor to developing an effective deployment or migration plan that is executable in a timely fashion.

The types of application and services workloads your business runs may lend itself to a particular cloud service or deployment strategy. The sheer number and variety of cloud service offerings makes this decision challenging without the proper guidance. A misfire on a cloud migration can be very costly in terms of time and money.

Skyrym has the knowledge and experience to turn cloud migration or deployment uncertainty into success.

Cloud Execution

Skyrym wants to help you realize your cloud strategy by putting our cloud engineering and deployment experience to work for you.

We will work with you to design, plan, and execute your cloud migrations and deployments whether IaaS, PaaS, or native cloud services.

Why deploy your infrastructure manually when you can leverage automation and orchestration tools to do it for you to achieve consistently successful results.

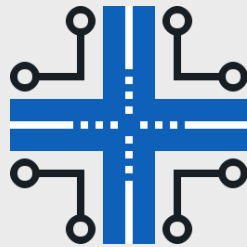

Skyrym can help you navigate the murky waters of cloud services and achieve a rapid ROI on your cloud spend.

Deployment and Integrations

Deploying and integrating workloads to a cloud platform, whether public or private, can be a daunting and resource intensive task. Cloud deployments fail for two primary reasons, lack of planning, and lack of expertise. Remove the risk of failed cloud deployments and enhance your cloud ROI by allowing Skyrym to deploy your workloads to the cloud.

Infrastructure Deployments

Allow Skyrym to assist you in deploying and integrating your infrastructure within any cloud model. We will also recommend real value added managed service providers to run your infrastructure for you, unburdening your business to focus on the bottom line rather than IT infrastructure.

Platform Deployments

There are a wide variety of automated build, test, and Platform as a Service (PaaS) offerings that can and should be leveraged in to achieve real IT agility. Why manage infrastructure if you don't have to?

Skyrym will help you minimize your infrastructure costs by leveraging the appropriate PaaS platforms and CI tool suites that will allow you to realize your agile DevOps, agile ProdOps, or CI/CD strategy.

Automation & Orchestration

Cloud services are built on this premise and provide a variety of automation tools and services to simplify and streamline your operational experience. These capabilities allow IT Ops teams to realize large improvements in operational efficiencies and quickly leverage the scale promises of cloud.

Skyrym will help you choose and deploy the right orchestration and automation methodologies and tool suites to fit your needs.

DevOps Solutions

Skyrym wants to help you determine the appropriate agile development and deployment strategies.

We will work with you to analyze your current development and deployment technologies, methodologies, tool suites.

The cornerstone of a successful DevOps program is platform(s) implementations. Skyrym will determine the platform(s) that best fits your organizations requirements and assist with a migration strategy.

Security is not realized by default by any platforms. We will assist in the development and deployment of industry best practices within the platform, enhancing your application security throughout the corporation.

Skyrym can help you enhance your enterprise application security through the appropriate strategy and platform selection to establish a secure DevOps eco system.

DevOps Readiness

Developing a strategic DevOps program requires a tremendous understanding of your current application eco system and a vision for enterprise wide application development moving forward.

Skyrym can assist you with developing a strategic DevOps program by analyzing current development lifecycles, processes, workflows configuration management systems, and development suites. Furthermore, we will assist with your DevOps strategy and platform(s)

DevSecOps Readiness

Agile development is rapidly being adopted, enabling corporations to connect with their customers at a faster pace than ever before. Security organizations are struggling to maintain the company's security posture without slowing down the agile development process.

Skyrym will help establish industry best practices and security standards throughout the processes, platform(s) configurations, and development suites.
